

Table 1: Response to Ownership Change by Baseline Occupancy Bin, Full Sample (Including Never-Treated Facilities)

Outcome	<70%	70–80%	80–90%	90–95%	>95%	Pooled
Facilities (treated)	605	316	334	147	41	1,443
Occupancy rate		–1.3655				
	4.3494*** (0.5971)	(0.8880)	–3.0662*** (0.8109)	–3.8738*** (0.9587)	–4.4806*** (1.2220)	2.8476*** (0.3463)
Medicare share	0.6803* (0.3557)	0.6137 (0.4816)	0.6971 (0.4651)	0.8964* (0.5381)	1.4579* (0.8111)	1.1001*** (0.2162)
Medicaid share		2.4298*	3.3672**	1.9892	–1.5564	
	–3.0560*** (0.8593)	(1.2402)	(1.4406)	(1.8264)	(2.7365)	–1.5780*** (0.5818)
Average length of stay	–4.3208 (5.5297)	–10.2213 (9.1493)	–11.9341 (8.6283)	–25.8507 (23.5596)	–34.0053 (40.0163)	–12.6762*** (4.5586)

Notes: Sample includes ALL facilities (treated and never-treated), anticipation window excluded. Treated facilities are classified by baseline occupancy over event_time $\in [-12, -4]$ (relative to their own acquisition); this is the only classification that affects the fitted coefficients. Never-treated facilities ($N = 6,198$) are assigned a placeholder bin (<70%), since *occ_bin* only enters the model through *post:occ_bin*, and *post*=0 always for never-treated facilities – their bin label is mathematically inert. Their role is to help pin down the calendar (year-month) fixed effects and other controls.

All specifications include facility and calendar-month fixed effects and the standard control set. Occupancy rate, spare capacity, Medicare share, Medicaid share, and average length of stay are excluded as controls from all four of these strategic-choice regressions. Anticipation window excluded.

Standard errors are clustered two ways by facility and calendar month. Statistical significance: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.
