# Introduction

This is my first slide.

# Event Study

$$Y_{it} = \sum_{\tau=-24}^{24} \beta_{\tau} \mathbf{1}\{\text{event\_time}_{it} = \tau\} \cdot \text{Treat}_i + X'_{it}\gamma + \alpha_i + \lambda_t + \varepsilon_{it}. \quad (1)$$

- $Y_{i,t}$  denotes nurse HPPD for facility  $i$  in month  $t$
- $\text{event\_time}_{it}$  measures the number of months relative to the month of ownership change
- $\text{Treat}_{i,t}$  is a dummy for if a facility is treated or not

and our variable of interest is  $\beta_{\tau}$  which captures the effect of an ownership change in month  $\tau$  after the event

# Two-way Fixed Effect

$$Y_{it} = \beta_{\text{post}} \text{Post}_{it} + X'_{it}\gamma + \alpha_i + \lambda_t + \varepsilon_{it}, \quad (2)$$
